

MANUAL OF SPECIFICATION (MOP)

GI APPLICANT NO.	02
DATE RECEIVED	06/01/2026
DATE MAILED	01/12/24

MANUAL OF SPECIFICATION

Manual of Specification serves as the primary technical blueprint that outlines the exact standards, measurements, and mandatory guidelines required for product compliance. It acts as an official document ensuring that every stage of development aligns with recognized industry benchmarks and statutory expectations. By standardizing these rules, it guarantees uniformity and serves as the legal foundation for evaluating whether a product meets the necessary qualifications for certification.

CAUSAL LINK

Casual Link establishes the direct, scientific, or historical relationship between the unique characteristics of the product and its specific geographic origin. This section demonstrates how the local environmental elements, traditional human expertise, and regional production methods directly influence and shape the distinct quality, reputation, and profile of the final output. It proves that the product's unique traits are not accidental but are inherently tied to its birthplace.

PRODUCTION PROCESS

Production Process details the step-by-step methodology, traditional techniques, and specific phases required to manufacture or cultivate the product from raw materials to its final state. This involves strict adherence to chronological procedures, sourcing requirements, and craftsmanship to ensure authenticity and historical continuity. By documenting every phase of manufacturing, it preserves the heritage and integrity required to maintain the product's distinctive identity.

QUALITY CONTROL

Quality Control defines the rigorous testing, inspection protocols, and verification measures enforced throughout the lifecycle of the product to ensure total compliance with established standards. It outlines the responsibilities of internal and external auditing bodies tasked with monitoring flaws, defects, or deviations. Through continuous sampling and verification, it guarantees that every batch entering the market consistently delivers the promised level of excellence.

LABELING RULES

Labeling Rules dictate the precise visual and textual requirements that must appear on the product packaging, including specific logos, protected terms, and certification symbols. These guidelines ensure that consumers receive clear, accurate information regarding the product's origin and authenticity while preventing deceptive marketing

practices. It also outlines font sizes, placement restrictions, and tracking numbers necessary for regulatory compliance and brand protection.

GEOGRAPHICAL AREA

Geographical Area clearly identifies the broader regional territory, microclimate, or specific province where the product's raw materials are sourced and processed. This section provides the environmental context, highlighting how the natural surroundings offer a unique ecological setting that cannot be replicated elsewhere. It establishes the baseline map that legitimizes the product's claim to a specific regional heritage and identity.

TERRITORIAL BOUNDARIES

Territorial Boundaries delineates the exact, legally recognized borders and administrative perimeters within which all or specific stages of production must take place. Using precise coordinates, landmarks, or regional zoning laws, it strictly limits production to a defined zone to prevent unauthorized imitation outside the designated area. Anyone operating outside these mapped lines is legally restricted from using the protected geographical indication.

SOIL COMPOSITION

Soil Composition analyzes the specific geological makeup, nutrient levels, pH balance, and mineral characteristics of the land where the raw ingredients are grown. It explains how unique earth layers—such as volcanic ash, limestone, or clay—provide the essential nourishment that directly impacts the structural growth, yield, and flavor notes of the agricultural yield. This physical foundation is a critical variable that fundamentally sets the regional product apart from global alternatives.

CLIMATE FACTORS

Climate Factors details the specific weather patterns, annual rainfall, temperature fluctuations, and sunlight exposure that define the growing or aging environment of the product. It emphasizes how unique micro climates, seasonal winds, or humidity levels interact with the production cycle to optimize quality and character. These atmospheric conditions create an irreplaceable natural incubator that directly dictates the seasonal success and sensory properties of the final product.

I declare that all the information provided above are true and correct to the best of my knowledge.
